MORSE & HRI
└ Overview
 └ Overview

A few facts on MORSE:

- 100% open-source, permissive BSD-like license
- Latest release (1.2.1) in July 2014
- 25kLOC of Python code
- Academic project, baked by academics
- Initiated at LAAS-CNRS in 2009
- Contributions by 12 institutions worldwide

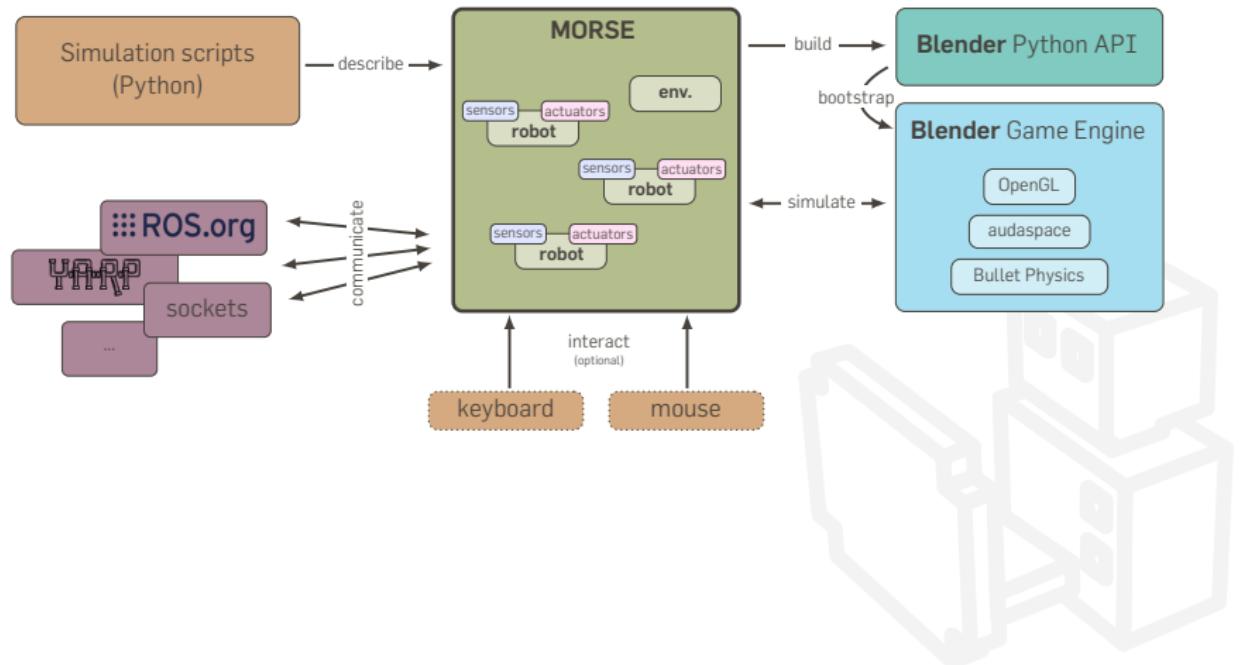

BRIEF RECAP OF MORSE

MORSE & HRI
└ Brief Recap of MORSE

BRIEF RECAP OF MORSE

A "SOFTWARE IN THE LOOP" SIMULATOR

2014-10-14

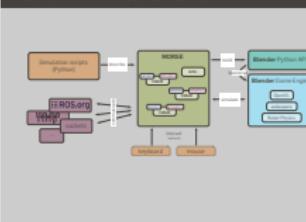

MORSE & HRI

Brief Recap of MORSE

- A "Software in the Loop" simulator

Describe the normal usage flow: Builder script → MORSE build the scene using Blender API, then start the BGE → further interactions via middlewares.

Humans are robots. We can optionally use keyboard + mouse to control them.

2014-10-14

MORSE & HRI

- Brief Recap of MORSE

```
> morse create my_sim  
  
> cd my_sim  
> ls  
default.py  scripts/  src/
```

How is it like to actually use MORSE?

Briefly explain default.py (illustrate the fact that robots are build out of actuators and sensors, and connected to one or several middlewares).

```
> morse create my_sim  
> cd my_sim  
> ls  
default.py  scripts/  src/
```

```
> morse create my_sim  
  
> cd my_sim  
> ls  
default.py scripts/ src/  
  
> morse run my_sim
```

2014-10-14

MORSE & HRI

- Brief Recap of MORSE

```
> morse create my_sim  
> cd my_sim  
> ls  
default.py scripts/ src/  
> morse run my_sim
```

How is it like to actually use MORSE?

Briefly explain default.py (illustrate the fact that robots are build out of actuators and sensors, and connected to one or several middlewares).

```

#! /usr/bin/env morseexec
from morse.builder import *
robot = Morsy()
robot.translate(1.0, 0.0, 0.0)

motion = MotionVW()
robot.append(motion)

keyboard = Keyboard()
robot.append(keyboard)

pose = Pose()
robot.append(pose)

robot.add_default_interface('socket')

env = Environment('sandbox')
env.set_camera_location([-10.0,
                        -10.0,
                        10.0])
env.set_camera_rotation([1.05,
                        0,
                        0,
                        0.78])

```

2014-10-14

MORSE & HRI

Brief Recap of MORSE

7

Describe how MORSE can easily be programmed to generate complex scenes.

Note that in this example, humans won't move by themselves. For that, one need to add a motion actuator, and write and external script to control the crowd.

```

1  from random import uniform
2  from morse.builder import *
3
4  robot = PR2()
5
6  for h in range(30):
7      human = Human()
8      human.translate(
9          uniform(-5, 5),
10         uniform(-5, 5),
11         0)
12
13     human.rotate(
14         0,
15         0,
16         uniform(0, 360))
17
18 env = Environment('sandbox')

```

SITUATION ASSESSMENT WITH HUMAN

2014-10-14

MORSE & HRI
└ Simulating HRI

└ Situation Assessment with Human

MORSE provides a virtual environment that we use to harness situation assessment algorithms that also include human-centered perspective taking. The robot updates its knowledge using its own position, human position and objects seen through abstracted, symbolic cameras provided by MORSE (so-called semantic cameras). In this particular scenario the human is sitting in a couch and ask the robot to bring specific objects that may be in another room (Pick-Place-Carry task).

LARGE SCENARI

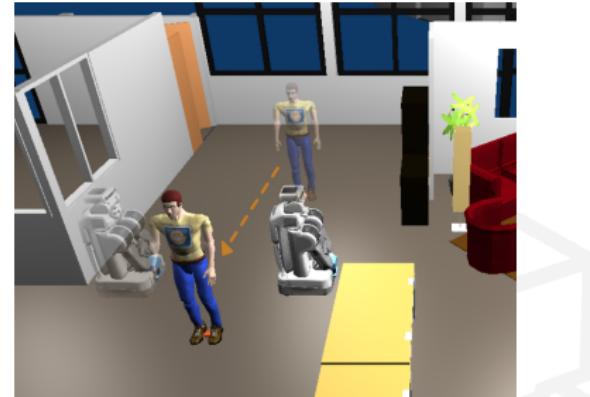

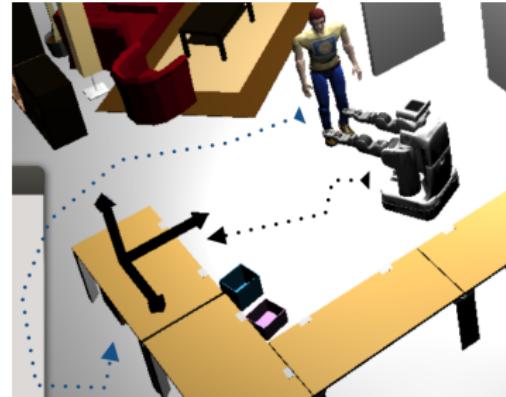

2014-10-14

MORSE & HRI
└ Simulating HRI
 └ Large Scenarii

An apartment is simulated in which a domestic service robot is living together with a person. A PR2 robot is controlled via ROS and the Cram reactive plan language, which is used on several other real robots. The robots' duty is to observe the person performing different activities and detect unexpected situations based on the validation of different types of expectations. The detection of such unexpected behavior can help future domestic service robots to better assess situations and adapt their actions to human behavior.

REFINING ALGORITHMS

2014-10-14

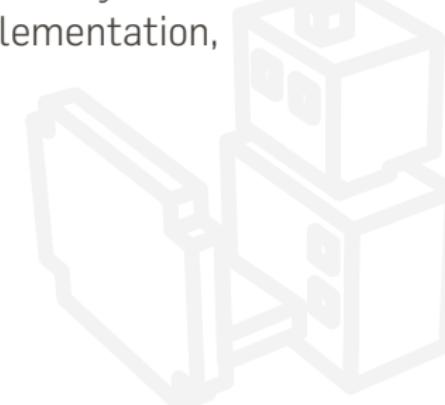

MORSE & HRI
└ Simulating HRI
 └ Refining Algorithms

Testing path planning algorithms (without killing humans and destroying robots...)

BENEFITS

Repeatable: fine for benchmarks, regression tests,
Abstraction levels: simulate only what is needed,
Computer game-style, tests can be carried by one researcher
alone: support iterative design and implementation,

AUTOMATIC HUMAN-LIKE SCENE GENERATION

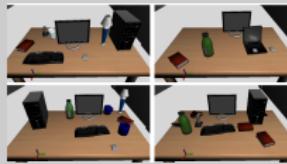

2014-10-14

MORSE & HRI

└ Less Usual Use-cases

└ Automatic Human-like Scene Generation

Aim: simulating credible human environments to train systems to appropriately react to them.

Robots need to know, when, where and how people manipulate objects and how they arrange and structure them in space → understand the long-term, spatio-temporal relationships of objects and activities of people.

We look at learning qualitative spatial relations of objects on office desks. As an accurate classification and pose estimation of objects on real-world office desks is still a challenging and difficult task for current robot perception systems we acquired a data set of object arrangements using the MORSE simulator. For this, we automatically generated a set of physically possible desktop scenes. Based on the generated data we learned relational models of object arrangements on desks. The learnt models enabled a robot to predict the position of an object given a landmark.

CONTINUOUS INTEGRATION AND HRI

2014-10-14

MORSE & HRI
└ Less Usual Use-cases

└ Continuous Integration and HRI

In human-robot interaction studies, robots often indicate behavioral variability that may influence the experiment's final outcome. However, manual testing on physical systems is usually the only way to prevent this, but remains labour-intensive. To tackle this issue, we introduced early automated prototype testing.

The goal is to incrementally decrease the level of abstraction until a satisfactory/sufficient degree of "realism" to make an assumption about real world behavior is reached — in an integrated and continuous approach.
